

Rod's 1APP Sales Manager Training Module

Goal: Rod can explain 1APP simply, diagnose the client's operational leak, prepare an approved quote, onboard the client, and hand Tony a build-ready file without guessing.

What Rod is selling

1APP is a managed automation and follow-up system for service businesses. Clients are not buying a pile of software features. They are buying a configured operating process that helps them:

- Respond to leads faster.
- Recover missed calls.
- Book and remind appointments.
- Follow up on inquiries and estimates.
- Organize leads and next actions.
- Request reviews consistently.
- Reduce repetitive administrative work.
- See what is happening in their pipeline.

Current offer

- Custom quote built from selected automations.
- Starts as low as **\$99/month**.
- **Revenue Reactivation Sprint:** no upfront setup fee, disclosed messaging usage, and a tiered/capped success fee tied to the written tracked result.
- One-time setup, monthly recurring service, usage/pass-through charges, and optional/custom work are quoted separately. HST is shown separately and is not a fifth price category.
- The smallest useful solution should be recommended first.

Revenue Reactivation Sprint rules

- The Sprint uses only an approved dormant lead/past-customer cohort; active opportunities and current estimates are excluded.
- The client must confirm a lawful contact basis in writing. Identification, opt-out, suppression, and stop rules are mandatory.
- The outbound campaign runs for 14 days after the approved list, message, tracking, and test pass are complete.
- The fee is selected from the approved job-value tier and includes a hard cap per attributed sale.
- Percentage fees use collected revenue or disclosed gross profit—not quoted contract value, verbal commitments, or unpaid invoices.
- Every Sprint records the success event, campaign ID, attribution window, outcome owner, reconciliation source, cancellations, and refunds.
- Initial capacity is limited to **four live Sprints** and **two new Sprint launches per week** unless Tony approves a written exception.

Rod's boundaries

Rod may:

- Prospect, qualify, demonstrate, follow up, and manage the sales team.
- Prepare quotes using approved catalogue items and bundle rules.

- Collect non-secret onboarding requirements.
- Track leads, opportunities, quotes, trial dates, tasks, and attribution.
- Guide the client through approved onboarding steps.

Rod may not:

- Promise technical feasibility, results, or launch dates without Tony's approval.
- Invent pricing, discounts, integrations, or custom deliverables.
- Publish or change live client automations.
- Collect passwords, payment details, API keys, or verification codes in forms, notes, email, or chat.
- Give associates administrator access.
- Quote a Sprint without the approved tier, fee basis, cap, attribution, and compliance controls.
- Promise a Sprint slot or start date before Tony accepts the handoff and confirms capacity.

Product-belief principle

Rod is not expected to believe in 1APP because of a feature list. He should believe in it because he can explain, measure, and defend the business change each automation is designed to create.

For every automation, Rod must know:

1. The symptom the owner notices.
2. The root process that is breaking.
3. The exact step 1APP changes.
4. Which of the five approved value categories applies: money saved, capacity recovered, revenue influenced, cash-flow improvement, or risk/visibility value.
5. The baseline and outcome metric used to prove it.
6. The variables outside 1APP's control.
7. The safe claim and the prohibited claim.

Rod must use `08-Automation-Value-and-ROI-Field-Guide.md` during discovery practice, quote preparation, trial design, and certification.

Eight-session training plan

Each session is 60–90 minutes. Rod must complete the exercise and pass the checkpoint before advancing.

Session 1 — The 1APP promise and ideal client

Learn

- Explain 1APP in 20 seconds:

1APP helps service businesses stop losing opportunities to missed calls, slow follow-up, forgotten estimates, no-shows, and scattered customer communication. We identify the leak and install the smallest useful automation system around the way the business already operates.

- Best-fit clients: active trades, contractors, local services, clinics, and appointment/estimate-driven businesses.
- Poor fits: no operating business, no decision-maker, guaranteed-results demands, primarily custom software requests, or refusal to provide setup information.

Exercise

- Give the 20-second explanation without naming an underlying platform.
- Identify three good prospects and one prospect to disqualify.

Pass checkpoint

- Clear explanation under 30 seconds.
- Does not call 1APP “just a CRM.”
- Does not promise leads or revenue.

Session 2 — Automation value and product belief

Rod must explain each automation as **symptom** → **root problem** → **process change** → **financial mechanism** → **measurement** → **limitations** → **setup requirements**.

1. Missed-call text-back.
2. Appointment booking and reminders.
3. Website form/chat lead capture.
4. CRM and sales pipeline.
5. New-lead follow-up.
6. Estimate/quote follow-up.
7. Review request automation.
8. Reactivation and nurture.
9. Invoice/payment reminders.
10. AI voice receptionist.
11. Reporting and analytics.
12. Custom automation/integration.

Exercise

For a plumber who misses calls and forgets estimates, Rod must:

- Establish the current missed-call and estimate-follow-up baseline.
- Recommend no more than three starting automations.
- Assign each recommendation to the correct approved value category and explain the mechanism without double counting.
- Build one value scenario using client-provided numbers.
- Identify every assumption and variable outside 1APP's control.
- Select the metric that would prove or disprove the recommendation.

Pass checkpoint

- Recommends based on pain, not feature volume.
- Explains the financial mechanism without calling a projection guaranteed ROI.
- Identifies dependencies and stop conditions.
- Escalates unknown integrations to Tony.

Session 3 — Discovery and qualification

Use SPIN:

Situation

- How do leads arrive today?
- Who responds, and in what tools?

Problem

- What happens when a call is missed?
- Where do booking, estimates, follow-up, reviews, or payments break down?

Implication

- How many opportunities or staff hours may be lost each week?

- What happens when the owner is on a job and cannot respond?
- What is the average collected job value, close rate, no-show rate, response time, or loaded staff cost relevant to this problem?

Need-payoff

- If that step happened automatically and the team could see the next action, what would improve?

Required qualification

- Real operating business.
- Decision-maker involved or accessible.
- One measurable operational problem.
- Willingness to complete onboarding, approve the dormant cohort, and report outcomes during the Sprint and attribution window.
- Use case 1APP can deliver reliably.
- A usable dormant list or a willingness to approve a paid setup project instead.

Exercise: run a 15-minute mock discovery, write a one-sentence problem statement, record the current baseline, and show the business-impact math with assumptions labelled.

Session 4 — Building the quote

1. Open the approved quote builder.
2. Select only automations supported by discovery notes.
3. Record the baseline, financial mechanism, primary success measure, variables outside 1APP's control, and evidence status.
4. Confirm scope, dependencies, usage assumptions, and exclusions.
5. Use a recommended bundle only when all bundle components solve a real problem.
6. Record the four commercial price categories separately: one-time setup, monthly recurring service, usage/pass-through charges, and optional/custom work. Show HST separately from those four categories.
7. Select either **Revenue Reactivation Sprint** or **Paid Implementation Required**; never leave the offer path ambiguous.
8. State that delivery time begins after complete handoff/access and Tony's queue acceptance.
9. Send the draft to Tony for technical approval and Justin for commercial approval.
10. Never send an unapproved quote.

Exercise: create two quotes from mock discoveries—one line-item quote and one bundle quote.

Pass checkpoint: totals are correct, no unnecessary automation, and no technical promise is unapproved.

Session 5 — Client onboarding and technical handoff

Rod owns completeness, not the technical build.

1. Confirm the accepted quote version.
2. Complete the master handoff template with the client.
3. Check every selected automation.
4. Complete the matching automation requirements.
5. Record approved copy, hours, owners, rules, success measure, and stop conditions.
6. Mark credentials/access as "secure access required"; never record the secret.
7. Identify open questions and client dependencies.
8. Review the handoff with the client.
9. Submit to Tony.
10. Resolve rejected or missing items before a build date is discussed.
11. Do not start the 14-day outbound window until Tony records that the approved cohort, lawful-contact attestation, message copy, campaign ID, stop logic, and test pass are complete.

Pass checkpoint: Tony can build without scheduling another discovery call to recover missing basics.

Session 6 — 1APP account, pipeline, phone, and daily rhythm

Rod works from the 1APP Corporate Sales account and Demo/Training account.

Daily

- Clear overdue tasks.
- Respond to new inbound leads.
- Review demos, custom quotes, and trial checkpoints.
- Coach associates and inspect CRM hygiene.
- Confirm every open opportunity has one owner and one dated next action.

Pipeline stages

1. New Lead.
2. Contacted.
3. Demo Booked.
4. Automation Audit Completed.
5. Custom Quote Draft — Approval Required.
6. Custom Quote Sent.
7. Quote Accepted — Onboarding.
8. Trial Setup.
9. Trial Live.
10. Trial Review.
11. Won — Paid Active.
12. Lost / Trial Ended.

Phone rule: Rod uses the dedicated 1APP sales number for business activity. Personal texting, unapproved bulk messaging, and bypassing consent/opt-out rules are prohibited.

Day-45 performance review

On Day 45 after Rod's Effective Date, Tony, Justin, and Rod conduct a documented performance review. This is separate from the Day-45 access review in the setup checklist.

The two required conversion rates are:

1. **Quote-acceptance rate:** accepted quotes ÷ decision-ready quotes.
2. **Sprint-to-paid-expansion rate:** clients buying broader automation ÷ Sprints that reached the results review.

The review must show the actual numerator, denominator, percentage, date range, and source report for each rate. It also reviews pipeline coverage, quote turnaround, handoff quality, Sprint outcomes, implementation load, and the reasons deals or Sprints did not expand. Tony confirms delivery capacity, Justin confirms sales coaching priorities, and Rod leaves with a written 45-day action plan. Targets or compensation change only through a signed written amendment; the review itself does not automatically change them.

Session 7 — Value lab and proof-based selling

Rod must complete three business cases using the field guide:

1. A contractor losing missed calls.
2. An appointment business with scheduling work and no-shows.
3. A contractor with unworked estimates.

For each case he must:

- Diagnose before prescribing.
- Use only the scenario's supplied numbers.
- Distinguish all five approved value categories: money saved, capacity recovered, revenue influenced, cash-flow improvement, and risk/visibility value.

- Calculate one transparent value scenario.
- Explain what would be measured during the trial or first 30 days.
- State what 1APP cannot control.
- Deliver a 60-second buyer-safe recommendation without a guarantee.

Pass checkpoint: correct math, correct attribution language, one measurable outcome, no double counting, and no unsupported claim.

Session 8 — Certification

Rod must complete:

- 34-question knowledge test: minimum 85%.
- 15-minute discovery role-play: minimum 4/5.
- Quote-builder test using the live builder, included offline HTML, or Document 09 printable worksheet: pass/fail.
- Client onboarding handoff: no critical omissions.
- 90-second demo pitch plus two objections.
- Three automation value explanations and one live ROI scenario: minimum 4/5.
- Live system navigation: contact, opportunity, task, call note, quote ID, and trial dates.
- Security test: recognizes that passwords, codes, and card information never belong in CRM notes.

Rod is certified only after Tony approves technical handoff competency and Justin approves sales competency.

Objection responses

“It costs too much.”

Before we compare the price, which part feels out of line—the setup work, the monthly service, or whether the problem is expensive enough to solve? We should compare the quote with the cost of missed opportunities and staff time, not with software the business must build itself.

“We already have software.”

That may be fine. What do you wish the current setup did more consistently? If there is no meaningful gap, I would not recommend replacing it.

“Can you guarantee more jobs?”

No responsible provider can guarantee lead volume or revenue. We can build and test the response, booking, follow-up, and tracking process so fewer existing opportunities are lost.

“Can you integrate with this tool?”

I will document the exact system and workflow and have Tony confirm feasibility, scope, and timing before we promise it.

Final certification standard

Rod is ready when he can answer seven questions for every deal:

1. What business problem are we solving?
2. Which exact automation solves it?

3. Which of the five approved value categories applies, and how does the automation create that value?
4. Which client-supplied baseline and success metric will prove or disprove the value?
5. Which assumptions and variables are outside 1APP's control?
6. What does the client have to provide?
7. What must Tony build, test, and approve?
