

Peterborough Waterproofing Call Prep & Presentation Notes

Prepared for Tony DeCarlo — Tony's Business Solutions

Business: Peterborough Waterproofing **Contact:** Belinda Scollick, Justin Roffey's assistant **Context:** Justin needs time back and help with phones, booking jobs, admin load, and follow-up. **Goal for Tony:** Explain Tony's Business Solutions in simple business terms — not tech jargon.

One-Line Positioning

Tony's Business Solutions helps local contractors stop being tied to the phone by answering leads, booking estimates, sending follow-ups, and keeping customer conversations organized automatically.

Knowledge Base Description

Tony's Business Solutions helps contractors capture missed calls, answer leads, book appointments, automate follow-up, and get time back using AI and GHL.

Easy Explanation of What Tony Does

"What I do is help businesses like yours stop losing time to the phone. If someone calls and you're busy, the system makes sure they still get answered, followed up with, and pointed toward booking an estimate. It keeps the jobs organized so you're not chasing messages all day or losing work because you couldn't answer at the exact second someone called."

Presentation Structure

1. Start With Their Problem

“From what I understand, the biggest issue is time. Calls, messages, bookings, follow-ups, and admin are pulling Justin away from the actual work and decision-making in the business.”

Key pain points:

- Missed calls can turn into missed jobs.
- After-hours leads may not get handled quickly.
- Customers expect fast replies.
- Booking estimates manually eats up time.
- Follow-up gets hard when the team is busy.
- Admin work keeps Justin tied to the phone.

2. Explain the Cost of Doing Nothing

“When someone has water coming into their basement, mold concerns, or foundation problems, they usually want help fast. If they call and don’t get an answer, there’s a good chance they call the next company.”

Main point:

“This is not just about convenience. It’s about protecting the leads you already paid for or earned through your reputation.”

3. Show the Better Way

“The system acts like a front desk assistant that is always available. It can answer, respond, collect the right details, book estimates, send reminders, and keep everything organized so the team is not starting from scratch every time someone reaches out.”

4. Tie It to Getting Their Time Back

“The value is not just more leads. It’s giving Justin and the team their time back. Instead of constantly stopping to answer messages, chase callbacks, or remember who needs follow-up, the system handles the repetitive parts.”

Time-back examples:

- Less time answering the same questions.
- Less time chasing missed calls.
- Less time manually confirming appointments.
- Less time remembering who needs follow-up.
- Less stress from leads slipping through the cracks.

What the Process Looks Like From Start to Finish

Use this to explain the project in plain English:

“The first step is not me forcing software into your business. The first step is mapping how your business actually handles calls, leads, estimates, follow-up, and admin right now. Then I build the system around that, test it with you, and only turn it on once it works the way you want.”

Step 1 — Discovery and Workflow Map

Goal: understand how Peterborough Waterproofing currently runs.

What Tony needs to learn:

- What happens when a new customer calls.
- Who answers during business hours.
- What happens after hours.
- How estimates are booked.
- What information is needed before an estimate.
- Who handles follow-up.
- Where leads currently get tracked.
- Which admin tasks are slowing Justin and Belinda down.

Step 2 — Decide the Phone Number Path

There are two clean setup paths.

Path A — Automate their existing business number

Best if they want to keep using the current public business number as the main number customers already know.

Timeline: usually **2–3 weeks** before the number is fully ready inside LeadConnector/HighLevel.

Why it takes longer:

- The number has to be checked for eligibility.
- Porting or carrier setup has to be completed.
- Business SMS registration may be required.
- Call routing has to be tested before going live.

Plain English explanation:

“If you want the current business number automated, that can absolutely be done, but it is not instant. The number has to be moved or connected properly so calls and texts can run through the system. That usually puts us in the two-to-three-week range before it is fully live.”

Path B — Use a new dedicated business automation number

Best if they want the fastest setup and want to separate personal, admin, and business communication.

Timeline: works **as soon as setup is finished**, usually within a few business days depending on how much automation they want.

Why this is faster:

- Tony can provision the number directly inside the system.
- Calls, texts, missed-call follow-up, and booking flows can be tested right away.
- It keeps business communication separate from personal phones.
- The old number can still exist while the new number handles automation.

Plain English explanation:

“The fastest route is I get you a new dedicated business number. That number can be connected to the system right away, and it separates business calls and texts from personal phones. You can still keep your current number, but this gives the automation its own lane.”

Step 3 — Build the Core System

Once the path is chosen, Tony builds the foundation:

- Business phone number setup.
- Missed-call text-back.
- Booking calendar or estimate request flow.
- Appointment confirmations.
- Appointment reminders.
- Lead follow-up messages.
- Contact records and conversation history.
- Mobile app access for the people who need it.
- Basic pipeline or lead stages if useful.

Step 4 — Test Before Launch

Before anything goes live, test the real customer experience:

- Test missed calls.
- Test text replies.
- Test booking flow.
- Test appointment reminders.
- Test notifications to Belinda/Justin.
- Confirm the wording sounds like Peterborough Waterproofing.
- Confirm the team knows where messages and appointments show up.

Step 5 — Go Live

Once approved, the system starts handling real leads.

The goal is a controlled launch, not chaos:

- Start with the most important flow first.
- Watch the first leads closely.
- Fix small friction points quickly.
- Keep the system simple enough that the team actually uses it.

Step 6 — Optimize After Real Use

After launch, Tony reviews what is happening and tightens the system.

Examples:

- Adjust message wording.
 - Improve lead questions.
 - Add follow-up steps.
 - Add review requests.
 - Add invoice/payment workflows if needed.
 - Add more automation only after the basics are working.
-

Setup Timelines Based on Business Needs

Fast Setup — New Dedicated Business Number

Best for: getting live quickly, separating business from personal, testing automation without disrupting the existing number.

Typical timeline: **3–7 business days** after Tony has the required business details.

What can usually be live quickly:

- New business number.
- Missed-call text-back.
- Booking/estimate request flow.
- Confirmation and reminder messages.
- Mobile app access.
- Basic contact organization.

Standard Setup — Existing Business Number Automation

Best for: businesses that want customers to keep calling the same public number.

Typical timeline: **2–3 weeks** depending on carrier, number eligibility, and registration requirements.

What happens during this time:

- Confirm the number can be connected or ported.
- Complete phone/registration requirements.
- Build the workflows while the number process is underway.
- Test call routing and texting before launch.
- Go live once the number is ready.

Expanded Setup — More Complete Operations System

Best for: businesses that want more than phones and booking.

Typical timeline: **2–4 weeks**, depending on complexity.

Possible additions:

- Multiple calendars or crews.
 - Pipeline stages for estimates/jobs.
 - Review request automation.
 - Lead nurture for people who do not book right away.
 - Invoice/payment workflows.
 - Website forms or funnel pages.
 - Staff permissions and task management.
-

Onboarding Process and What Tony Needs From Them

What Tony Needs Before Build Starts

- Business name, address, website, and main contact info.
- Current business phone number and whether they want to keep using it.
- Main services offered.
- Service area.
- Business hours.
- After-hours preference.
- Team members who need access.
- Calendar availability for estimates.
- How long an estimate usually takes.
- Who should receive new lead notifications.
- Current booking process.
- Current follow-up process.
- Common customer questions.
- Preferred tone for customer messages.
- Logo/brand assets if they want branded emails or forms.

Onboarding Timeline Tony Can Explain

Day 1 — Discovery and decision

- Confirm the problem they want solved first.
- Choose phone path: existing number or new dedicated number.
- Confirm what the first version of the system needs to do.

Days 1–3 — Information collection

- Gather services, hours, calendar rules, team access, message preferences, and business details.
- Draft the customer-facing messages.

Days 3–7 — Build and internal testing

- Build the core workflows.

- Set up the number path.
- Set up calendar/booking or estimate request flow.
- Test calls, texts, reminders, and notifications.

Week 2 — Team review and adjustments

- Walk Belinda/Justin through the system.
- Adjust wording and routing.
- Make sure the mobile app is easy for the team to use.

Weeks 2–3 — Existing number launch, if applicable

- If they are automating the current business number, the launch depends on number readiness.
- Workflows can be built while the number process is underway.
- Final go-live happens after call/text routing is tested.

Tony's Simple Explanation

“My job is to do the build and make the system simple for you to use. Your job is mainly to tell me how the business actually operates — who answers calls, how estimates get booked, what information you need from customers, and what you want the customer experience to feel like.”

What Good Looks Like

Good does not mean complicated. Good means the system saves time, captures more opportunities, and is easy enough that the team actually uses it.

For Justin

- Fewer interruptions during the day.
- Less time tied to the phone.
- Clear visibility into new leads and appointments.
- Confidence that missed calls are not being ignored.
- More time focused on jobs, customers, and running the business.

For Belinda/Admin

- One place to see conversations, missed calls, appointments, and follow-up.
- Less manual chasing.
- Easier appointment confirmations and reminders.
- Cleaner customer notes and contact history.
- Better organization without needing to be tech-savvy.

For Customers

- Faster response when they call or message.
- Clear next steps.
- Easy way to request or book an estimate.
- Fewer missed callbacks.
- Professional communication that feels organized.

Early Wins to Look For

- Missed calls get an automatic response within seconds.
- Leads know how to request an estimate without waiting.
- Appointments are confirmed automatically.
- Reminders reduce no-shows or forgotten appointments.
- Belinda and Justin can see customer communication from the mobile app.
- Follow-up happens even when the team is busy.

How to Explain the HighLevel Mobile App Simply

Use this wording:

“The mobile app is basically your command center on your phone. You do not need to sit at a computer all day. Once I set the system up from desktop, you can use the app to answer messages, return calls, check appointments, send invoices, view contacts, and manage daily follow-up.”

Simple analogy:

“Think of desktop as where the system gets built, and the mobile app as where your team uses it every day.”

What They Can Do From the App

They can:

- View and reply to SMS, email, WhatsApp, Facebook, Instagram, and website chat conversations.
- Make and receive business calls.
- Send voice notes, images, and files.
- See customer contact details.
- Add notes after calls.
- Create and manage tasks.
- View and manage appointments.
- Send review requests.
- Respond to reviews.
- Create and send invoices after payment setup is connected.
- Use point of sale or tap to pay if configured.
- Move opportunities through a pipeline if the pipeline is already set up. A pipeline is a simple visual tracker that shows where each lead/customer is in the process — for example: New Lead, Contacted, Estimate Booked, Estimate Sent, Job Won, Job Lost. It works like moving cards from one stage to the next so the team can quickly see what needs attention and nothing slips through the cracks.
- Get push notifications for new messages, calls, tasks, and appointments.
- If Justin or Belinda are busy, away, or on vacation, the business number can be forwarded or routed to another approved staff member so they can respond, manage conversations, and keep leads moving through the app.

What They Cannot Really Build From the App

They usually cannot build the deeper setup from mobile.

Desktop is needed for:

- Building workflows and automations.
- Creating pipelines and stages.
- Setting up calendars.
- Creating custom fields.
- Connecting Stripe.
- Setting up phone numbers and A2P registration. A2P means “Application-to-Person” messaging. In plain English, it is the business texting approval process that helps carriers verify the business and reduce spam so automated texts are more likely to deliver properly.
- Building websites, funnels, forms, and email campaigns.
- Managing advanced integrations.

Easy Way to Explain This to Belinda

“You and Justin would not have to build the system yourselves. That’s what I handle. Once it is built, the app is what you use day-to-day. You can reply to customers, check appointments, see who called, make notes, send invoices, and keep jobs moving from your phone.”

Best Use Cases for Their Team

For Justin:

- Quickly see important leads and messages.
- Know what appointments are coming up.
- Get visibility without being buried in admin.

For Belinda/admin:

- Reply to messages.
- Confirm appointments.
- Add notes.
- Manage tasks.
- Keep customer info organized.

For field/service staff:

- See customer details.
- Add job notes.
- Call or message customers.
- Take payments if enabled.

Staff Coverage When Justin or Belinda Are Away

A strong point to explain on the call:

“If Justin or Belinda are busy, on a job, away from the phone, or even on vacation, the business number does not have to stop with them. I can set it up so calls, texts, and lead notifications can be forwarded or routed to another approved staff member. That staff member can respond, manage conversations, check appointments, and keep leads moving through the mobile app.”

Why this matters:

- The business is not dependent on one person being available.
 - Leads can still be answered when Justin or Belinda are busy.
 - Staff can help manage customer communication without using personal phones.
 - The customer experience stays consistent even when someone is away.
 - Everything still stays organized inside the system.
-

FAQ for Tony's Business Solutions

What exactly do you do?

We help local businesses automate the repetitive parts of customer communication — missed calls, text replies, appointment booking, reminders, follow-up, reviews, and basic lead management.

Is this just a chatbot?

No. A chatbot is one piece. The bigger value is the full system behind it: calls, texts, booking, reminders, follow-up, reviews, invoices, and organized customer records.

Will it replace our staff?

No. It supports your staff. It handles repetitive tasks so your team can spend more time on real customer service and actual work.

Can it answer calls?

Yes, if they want that as part of the setup. It can answer calls, collect basic information, answer common questions, and help route the customer toward an estimate or callback.

Can it text customers automatically?

Yes. It can respond to missed calls, send confirmations, send appointment reminders, and follow up with leads who have not booked yet.

Can it book appointments?

Yes. Once the calendar is set up, the system can guide people toward booking an estimate or appointment.

Can we still answer manually?

Yes. You stay in control. The system helps when you are busy, after hours, or when follow-up needs to happen automatically.

Will customers know it is automated?

That depends how you want it positioned. The goal is to make it clear, helpful, and professional — not fake or confusing.

What if the system does not know the answer?

It should not guess. It can collect the customer's information and let them know someone from the team will follow up.

Can this work from our current phone number?

Yes, but automating the current business number usually takes longer because the number has to be connected properly. The faster option is using a new dedicated business automation number.

Do we need to be tech-savvy?

No. Tony sets up the system. The team mostly uses the mobile app to respond, check appointments, make calls, and manage daily activity.

How long does setup take?

A new dedicated number setup can usually be live within a few business days after Tony has the required details. Automating an existing business number is usually a 2–3 week process.

What businesses is this best for?

Local service businesses that depend on calls, estimates, appointments, and fast follow-up — contractors, waterproofing, roofing, HVAC, plumbing, landscaping, electricians, and similar trades.

Questions Tony Should Ask on the Call

Current Call Handling

1. How many calls do you miss in a normal week?

Response:

1. Who answers the phone right now?

Response:

1. What happens when someone calls after hours?

Response:

1. Are jobs ever lost because callbacks happen too late?

Response:

Booking and Estimates

1. How are estimates booked right now?

Response:

1. Do you want the system to book directly into a calendar, or just collect the information and notify the team?

Response:

1. Would you want customers to get automatic appointment confirmations and reminders?

Response:

Admin and Team Workflow

1. What admin tasks are eating up Justin's time the most?

Response:

1. Who would be using the mobile app day-to-day?

Response:

1. Who should get notified when a new lead comes in?

Response:

Phone Number Decision

1. Do you want to automate the current business number, or use a new dedicated business automation number?

Response:

1. If we used a new dedicated number, where would you want that number shown — website, Google Business Profile, ads, voicemail, or only for follow-up?

Response:

Reviews, Follow-Up, and Success

1. Do you currently ask happy customers for Google reviews?

Response:

1. What kind of follow-up do you want customers to receive if they call but do not book right away?

Response:

1. What would make this feel like a win 30 days after launch?

Response:

Close / Next Step

“If this makes sense, the next step is simple. I would map out the exact flow for Peterborough Waterproofing — what happens when someone calls, texts, books, misses an appointment, or needs follow-up. Then I can show you what the customer experience would look like before anything goes live.”
